

LongRiverTech

ERP and management software

Invoicing-Trading-Funding-Project customization-Consulting

Preface

For most enterprises, the focus of ERP management is the unified management of logistics, capital flow and information flow in the process of purchase, sales and production. Usually, as a node in the industrial chain, an enterprise only pays attention to the material and capital transactions of upstream and downstream suppliers and customers directly related to itself, as well as its own production, processing and assembly flow.

With the development concept of "independent innovation, healthy ecology, harmony and win-win", Long River Technology has gradually developed a number of product lines with independent intellectual property rights. LongRiverTech ERP management software has a long history and a lean design. Although the sparrow is small, it has all the internal organs. It is very suitable for the customization, deployment and implementation of small and medium-sized enterprises.

The Core Objectives of ERP Management

LongRiverTech Consulting(ERP)

LongRiverTech's three independently evolving product lines sometimes intersect, creating different sparks and tailoring them to suit different application scenarios.

Purchase, sale and inventory

Overview of purchases, sales and inventory via transaction flow

Manufacture

BOM and process flow build the framework of production flow

Project Management

Multi-level WBS structures of projects and tasks coexist with complex network diagrams

Production management

BOM,
processing cost accounting,
material tracking

Engineering Management

Integration of projects,
materials, contracts and
orders, and accounting

Trade management

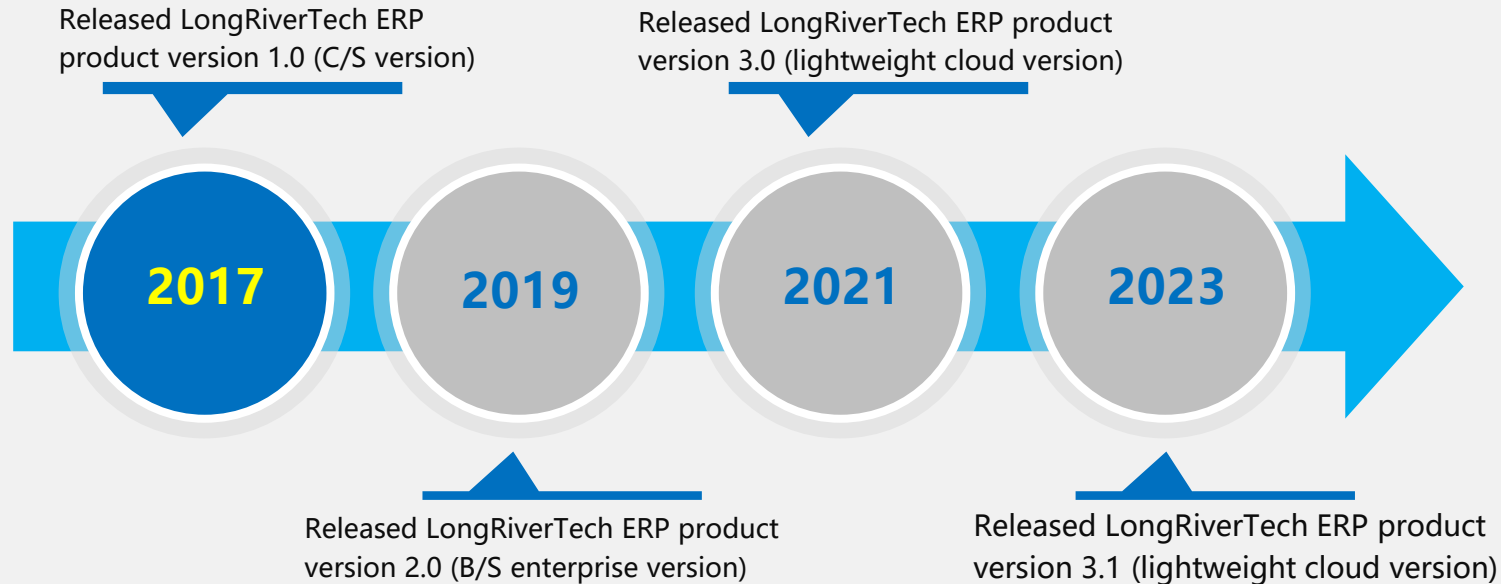

Domestic and foreign trade,
Purchase, sale and inventory,
Import and export, Logistics

Process flow

Process cards,
QR code driven operations,
materials and schedules

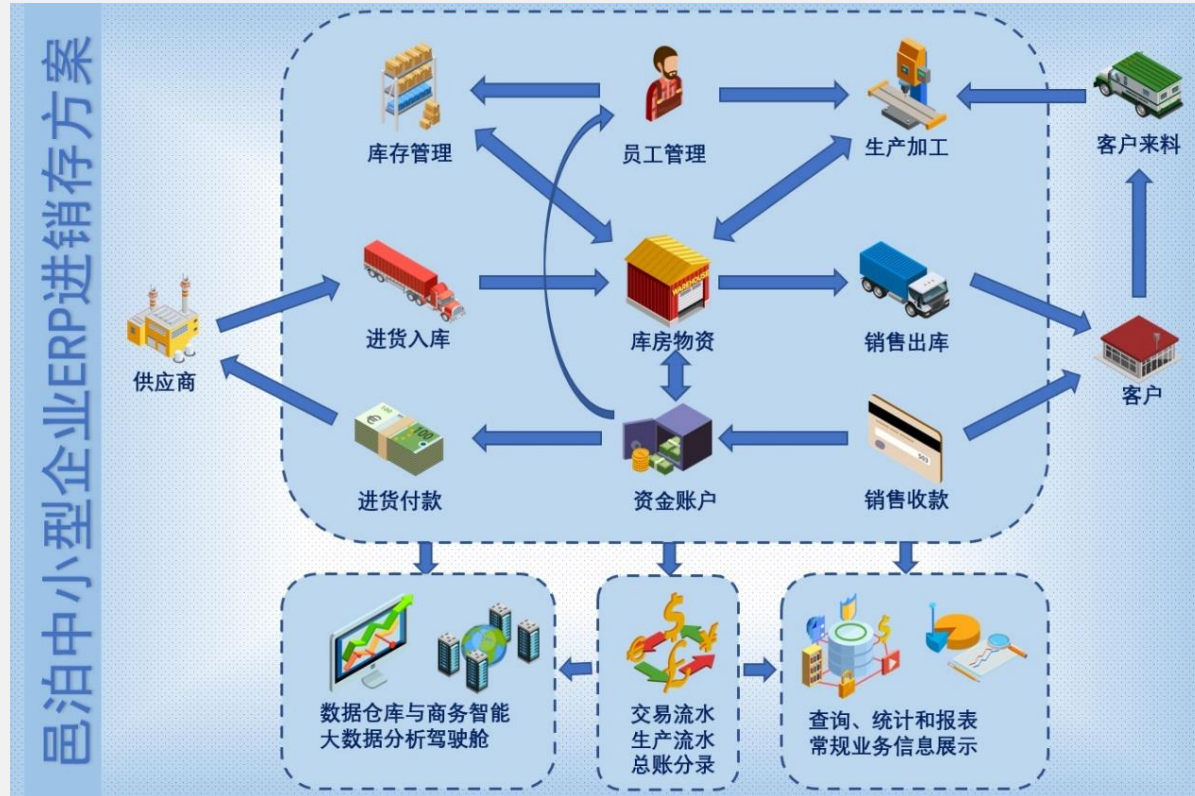

Since LongRiverTech released its first ERP product in 2017, LongRiverTech has continued to invest resources in the continuous iteration and evolution of the ERP product line. In 2019, the first enterprise version based on B/S web architecture was released, which supports cloud deployment and operation. LongRiverTech enterprise overall management software system is committed to helping the development of the new economy of the Industrial Internet, Industry 4.0 and intelligent manufacturing. LongRiverTech is a one-stop ERP system for small and medium-sized enterprises, which can be customized for personalized business and deployed on cloud platforms. In 2021, LongRiverTech released the first cloud service brand "Hanju", providing a new SaaS operating environment and business model for the release and service of subsequent ERP products.

Implementation plan for purchase, sale and inventory of small and medium-sized enterprises

LongRiverTech Consulting(ERP)

For most small and medium-sized enterprises, the focus of ERP invoicing lies in the unified management of logistics, capital flow and information flow in the process of purchase, sales and production. Usually, small and medium-sized enterprises, as a node in the industrial chain, only pay attention to the material and capital transactions of upstream and downstream suppliers and customers directly related to themselves, as well as their own production, processing and assembly flow.

Implementation plan for purchase, sale and inventory of small and medium-sized enterprises

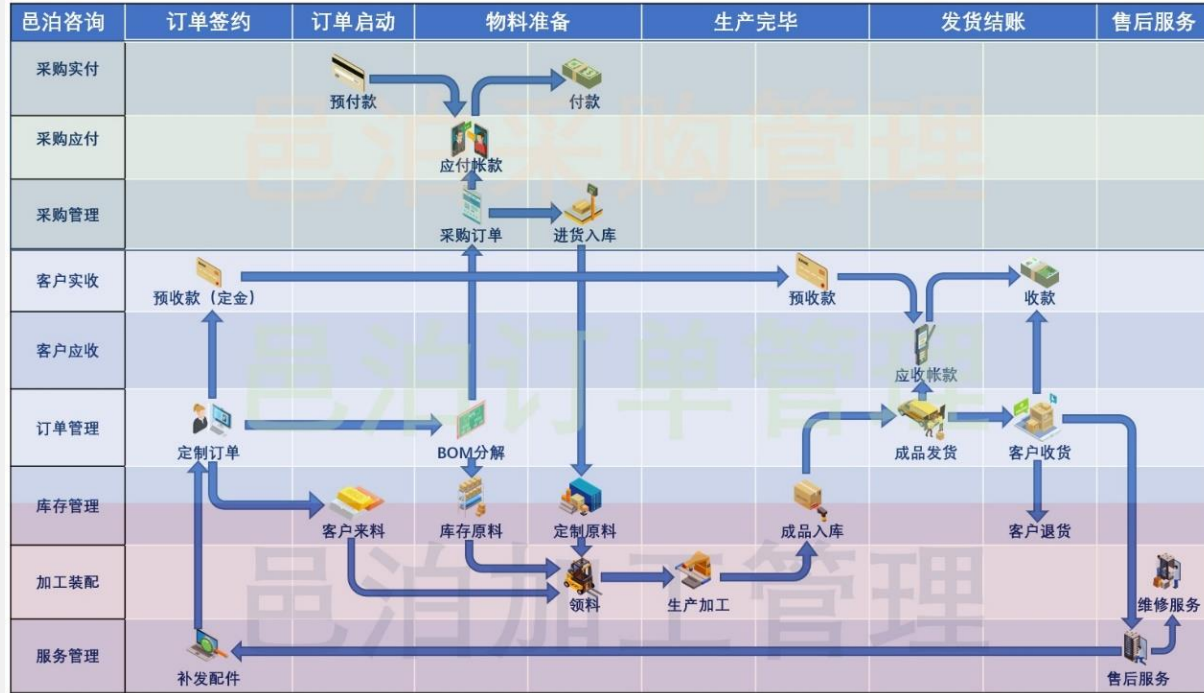

LongRiverTech Consulting(ERP)

Ideally, the settlement and payment of the payment for goods are in one-to-one correspondence and occur at the same time, but in actual small and medium-sized enterprises, there are a large number of goods before payment, first payment before goods, book-entry down payment and centralized settlement, installment payment and A variety of different goods and payment separation modes such as delivery. There are a large number of many-to-many compound nesting and association relationships in the flow of goods and materials, capital payment and settlement flow, and production and processing workflow, which increases the difficulty and workload of small and medium-sized enterprises in the management and control of business data. Through the implementation of the ERP purchase, sales and inventory plan for small and medium-sized enterprises in LongRiverTech, different payment receipt and payment templates can be adopted according to the characteristics of different businesses, and after entering the business documents, the warehouse of goods and materials, funds receivable and payable, production and processing raw materials and products can be automatically established. All-round relationship between finished products, accounts, warehouses, employees, machinery and equipment, factories, stores, etc. Through the standardized ERP invoicing business process, the operational risk of business execution is minimized, and the risk control measures such as credit limit and risk exposure, such as upstream and downstream relationship limits, are used to minimize bad debt risks and capital costs. Based on the statistics and analysis of historical actual inventory, logistics and capital flow data, it can arrange the best inventory allocation, capital account and logistics distribution, and enhance the profitability and competitiveness of enterprises.

Production management implementation plan for small and medium-sized enterprises

LongRiverTech Consulting(ERP)

Small and medium-sized production and processing enterprises focus on production and processing to drive upstream procurement and downstream order management. The conventional ERP system of purchase, sale and storage satisfies the large-scale production management of batch products.

Mass-produced products with a high degree of standardization can quickly reach saturation through large-scale expansion, leaving a lot of room for growth in non-standard orders that require individual customization. For more innovative non-standard orders, it is increasingly dependent on the auxiliary management of computer systems to cope with the explosive growth of business data.

02

ERP project management

Consultation, contract, customization,
production, service

Creativity and scope

In the project start-up phase, through initial negotiations and contacts, the functional scope and priorities are determined and a preliminary project proposal is formed.

Pricing and risk

During the project cooperation stage, through further brainstorming and detailed communication, the detailed functions and task breakdown will be determined, and a complete project plan and quotation will be formed.

Develop and delivery

After signing the project contract, the project execution phase begins. At this time, it is necessary to control the project progress, identify risks in advance, obtain feedback information, and deliver timely online.

Service and iteration

After the project is successfully launched, continuous project operation and maintenance services are also indispensable. Opportunities for further improvement, optimization and cooperation can be found through the project completion summary.

A successful project needs to go through many different stages from idea creation to online operation. At each stage, LongRiverTech will have in-depth communication with customers.

Software development has certain uncertainties and risks, and different processes are adopted for different types of projects:

- (a) Innovative projects with relatively high risks adopt the Agile Iteration method. One iteration stage is a cycle, and generally one iteration stage lasts from 2 weeks to 1.5 months.
- (b) For new feature development projects with relatively low risk, the more cost-effective waterfall model can be used to estimate development costs and formulate plans based on existing frameworks and experience.
- (c) Services, operations, maintenance, coding and testing are provided on a fixed-hour basis and are paid based on service time.

Utilize existing frameworks, experiences and templates to develop plans to maximize overall project cost-effectiveness. Based on this, agile methods are used to continuously iterate, innovate and adjust to adapt to the actual needs of customers as quickly as possible.

Development, deployment and implementation

- User acceptance test case preparation
- Data preparation and test-driven development
- Deployment environment communication and configuration
- User acceptance test data preparation

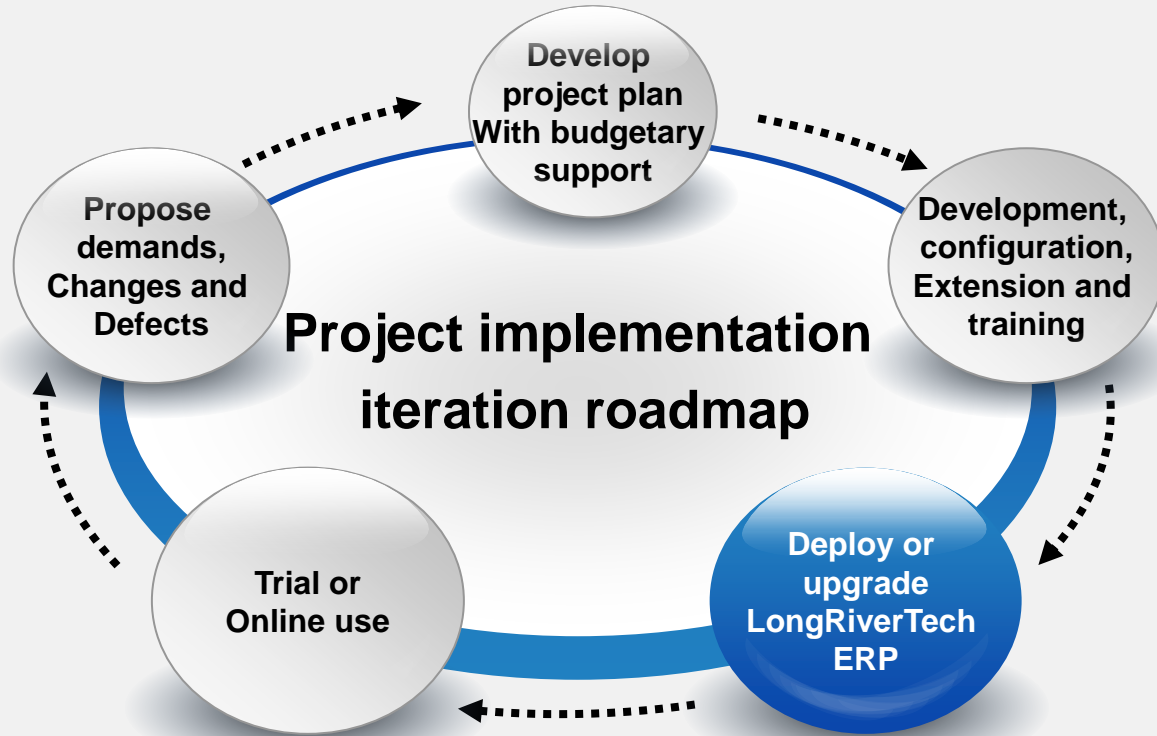

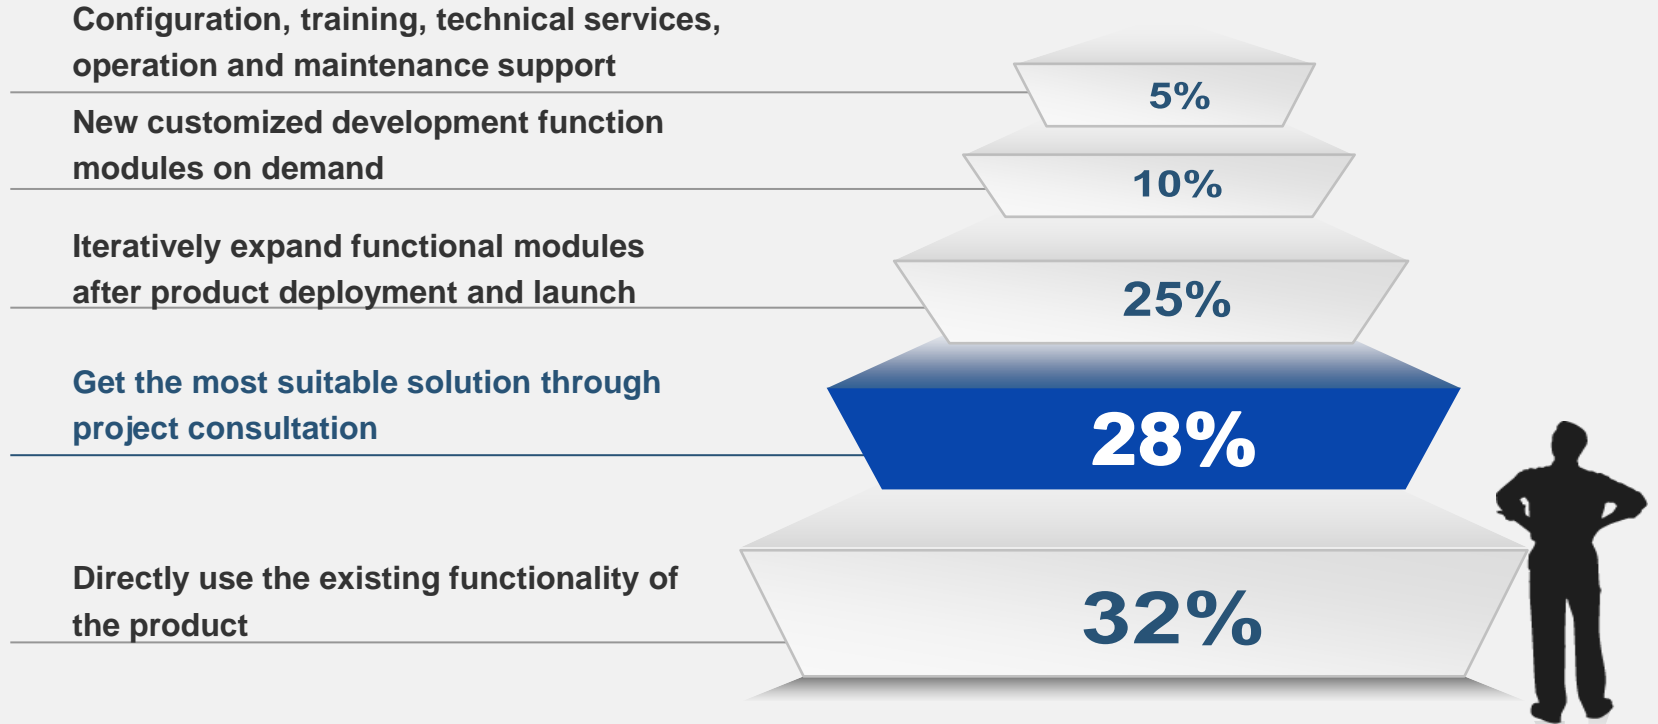

Overall project consultation

- Business scenario enumeration and communication
- Data model design and maintenance
- Preparation and drafting of project proposal

Acceptance, go-live and deliverables

- Online acceptance testing
- Project management documentation
- Preparation of user manual
- Preparation of system operation and maintenance instructions

Material management

Material parent node classification
Associate product with commodity for many-to-many relationships
Support importing Excel configuration
Intermediate materials and semi-finished products do not need to be associated with products and commodities
Raw materials and products need to be related to commodities
Customer incoming materials do not need to be related to the product

Process configuration

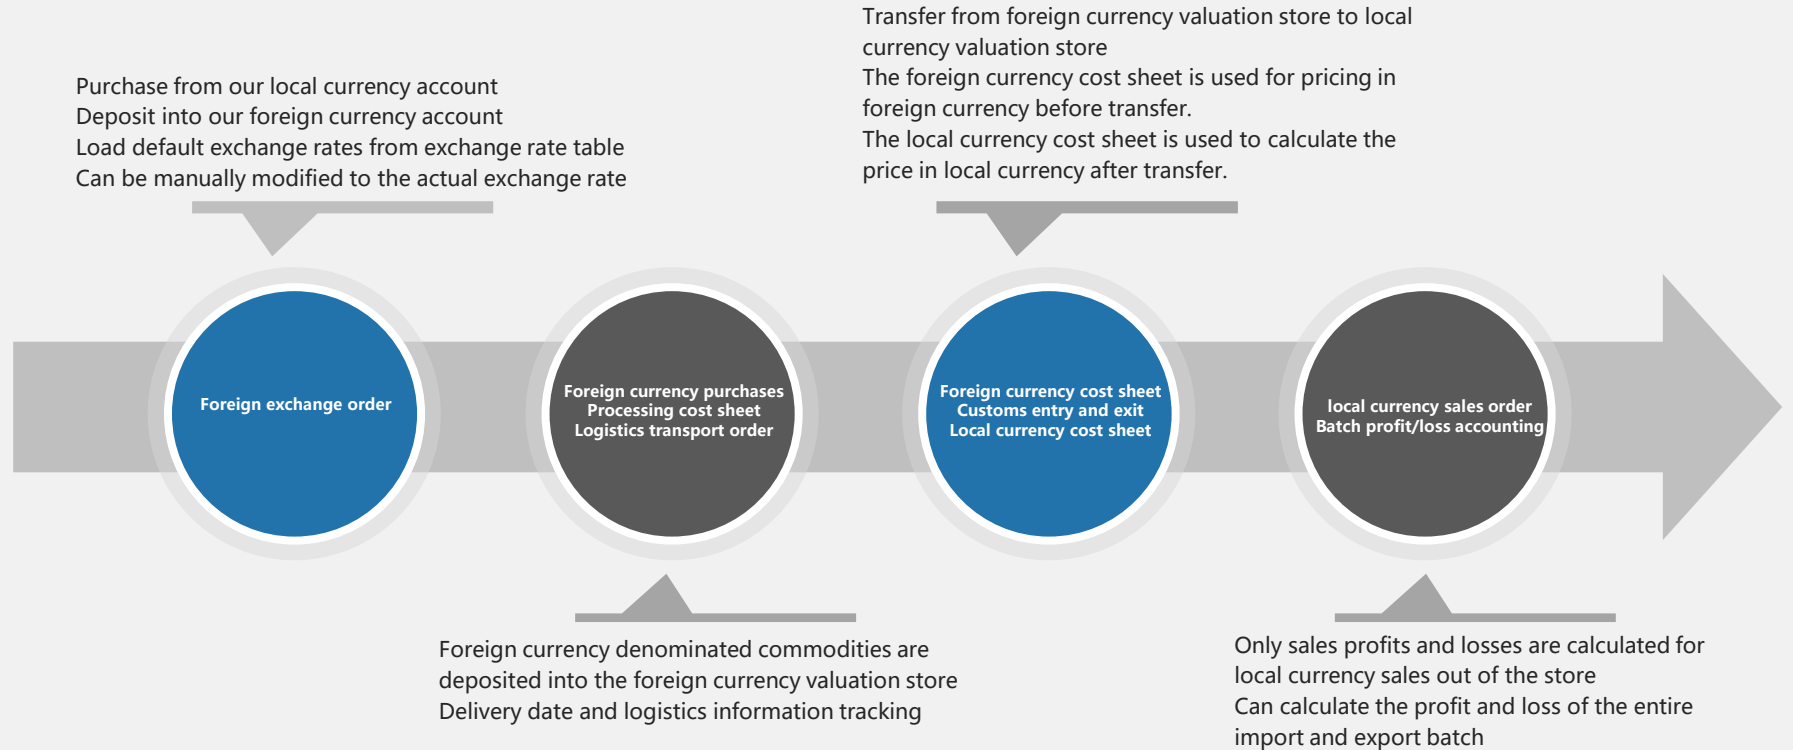

Process management supports importing Excel configuration
Process node maintenance
Process section settings
Process node operation steps
Process node BOM raw material configuration
Process node BOM product material configuration
Process node cost accounting configuration

Store out and in Temporary carry-on material

Raw materials and incoming materials during the production execution process need to be obtained from the store to the production batch, workshop or work group through the store out and in business orders and participate in production as temporary carry-on material. Finished goods need to be transferred to the store through cost store in. For customer-customized batches, a delivery note must be executed to end the batch.
